HOW YOU SHOULD BE LAWN-ING THIS SPRING:

Spring is the perfect time for seed germination, so top up any bare areas with topdressing & seed into it with the Munns Professional range of seeds.

With all this new growth coming, now is a great time to remove some old material. Scalping is a great way to remove the sponginess in your lawn.

For the ultimate renovation try scalping, coring & topdressing your lawn. For Buffalo & cool season grasses it's best to wait for the first weekend in October, & for warm season grasses wait for the first week in November.

Why am I applying these products through the Spring period?

Breaking the winter dormancy period is crucial to a good Spring start on lawns. This is the time when lawns move sideways to fill in bare areas and roots develop faster.

Buffalo Booster™ gives the lawn key nutrients to bounce back from dormancy.

Over this period there's a good chance your soil has dried out and become hydrophobic, **Smart Wetter™** helps remove this and also aids with nutritional uptake.

Root Regenerator™ helps to keep the lawns hormones at the right level.

Lift Off™ aids the process by providing the right balance of nutritional element to support this root and shoot establishment.

HOW YOU SHOULD BE LAWN-ING THIS SUMMER:

Keep your lawn watered regularly & check for water evaporation so you are only using what you need.

Monitor for insect pests & investigate damaged areas. To check for lawn pests, place a wet blanket over the area overnight & check in the morning for lawn pests that have come to the surface.

Monitor for leaf & crown diseases, add an extra dosage of **Root Regenerator™** to help with the stress of Summer.

Why am I applying these products through the Summer period?

Summer is always stressful for turf, with increased play and temperatures, so giving them some extra nutrition helps withstand these harsh conditions.

Green Dominator™ gives your lawn that extra impressive green colour when entertaining family or friends over the holiday period.

Keep water available to your lawn by adding some **Smart Wetter™** once a month, don't forget to hydrate yourself too!

High quality kelp products can help your lawns in times of stress, such as that summer heat! Adding some much needed **Root Regenerator™** to your watering regime will help with stress.

HOW YOU SHOULD BE LAWN-ING THIS AUTUMN:

Make sure your moisture levels don't drop too much. Just because it's cold doesn't mean your lawn can't dry out with strong winds. If you can't keep up the moisture add some Smart Wetter into the program to help reduce your watering.

Soil is at a perfect temperature for lawn seed germination. Seeding or laying new lawns now allows a full 6 months before it gets the heat of Summer. Monitor for the dreaded Winter weeds that pop up in March-April & stay on top of them as they pop up.

Monitor for lawn diseases like leaf spot & dollar spot.

Why am I applying these products through the Autumn period?

The key to a good Spring is all about the preparation you do for Winter. Your Winter lawn has to survive all those home ground footy and soccer matches so it's important to thicken your lawn now. This will also help protect it against weeds.

Giving your lawn a feed of **Buffalo Booster™** gives it extra Potassium for leaf strength against the cold and assists your lawn in taking nutrients down into its under ground parts, stored for early Spring greening next year. A fertilise now will help reduce the dormancy period.

The lawn soil is at the perfect temperature for root establishment until that first frost, so make the most of it by applying **Lift Off™** and **Root Regenerator™**.

With soil temperatures dropping now is the perfect time for Wintergrass to start growing, stop it before it comes up with a preventative application of **Munns Professional Wintergrass Killer™**.

HOW YOU SHOULD BE LAWN-ING THIS WINTER:

Come late winter those weeds in your lawn are going to be thinking about seeding. Get motivated & treat now because if they do they will return in greater numbers next year.

Review your treatment plan from last year, what worked & what didn't. Consider a call to the team at Munns for advice to get the best from your lawn & products. Give the mower a full service & sharpen your blades ready for the growing season.

Check out your hoses, sprinklers & if you're lucky enough your irrigation system. Consider getting a soil test done to help advise you on your program for spring renovation.

Why am I applying these products through the Winter period?

The cold has put lawns into dormancy and stopped growth. However, we recommend **Green Dominator™** over winter if you are located in a warmer region just to offset the discolouration as temperatures drop. Remember, if it's greener come Spring it will return to peak condition faster.

If you are located in an area of heavy frosts it's best not to apply anything during this time. Any new growth stimulated by products will become susceptible to cold temperature injury or disease.
