Create a waterwise garden

Help your garden survive through tough, dry times by:

1. Mixing **Yates Waterwise** water storage crystals into the soil before any new planting.
2. For existing plants, spoon crystals into vertical holes poked down into the root area.
3. Water or spread **Yates Waterwise** soil wetters (either dry or liquid, depending on your preference) around the base of the plant. These will help get maximum water into the roots.
4. Spray vulnerable plants with **Yates Stressguard**.
This reduces evaporation from the leaves and acts as a sunscreen, protecting tender leaves from sunburn.
5. During dry periods, feed plants with gentle, organic **Dynamic Lifter** pellets. These don't need to be watered in straight away but they'll be there to take advantage of any moisture that becomes available.
